## Assignment 2

## Oral questions

1. $2.4 / 12$
2. Complete the following proof of the theorem stating that the sum of the angles of a triangle $A B C$ is $180^{\circ}$. We draw parallel line to $A B$ through $C$ and use the notation introduced in the picture.

Applying Euclid's fifth postulate to the line $A C$ and the angles $180^{\circ}-\alpha$ and $\alpha^{\prime}$ yields $180^{\circ}-\alpha+\alpha^{\prime} \geq 180^{\circ}$. As a consequence we must have $\alpha^{\prime} \geq \alpha$. Similarly, applying Euclid's fifth postulate to the line $B C$ and the angles $180^{\circ}-\beta$ and $\beta^{\prime}$ yields $180^{\circ}-\beta+\beta^{\prime} \geq 180^{\circ}$, and so $\beta^{\prime} \geq \beta$. Hence we obtain

$$
\alpha+\beta+\gamma \leq \alpha^{\prime}+\beta^{\prime}+\gamma \leq 180^{\circ}
$$

Use Euclid's fifth postulate directly in two more situations to show that $\alpha+\beta+\gamma$ is also greater than equal to $180^{\circ}$.

## Questions to be answered in writing

1. $2.2 / 4$
2. $2.3 / 6$
