## Assignment 8

## Oral questions

1. Let $O$ be the center of the circle of inversion, $P^{\prime}$ the inverse of $P$ and $Q^{\prime}$ the inverse of $Q$. Assume that $O, P$, and $Q$ form a triangle. Show that $O P Q_{\triangle}$ is similar to $O Q^{\prime} P_{\triangle}^{\prime}$. Use this result to show that inversion preserves the cross-ratio: if $A, B, P$, and $Q$ are four points distinct from the center $O$ of the circle of inversion and $A^{\prime}, B^{\prime}, P^{\prime}$, and $Q^{\prime}$ are their inverses then $(A B, P Q)=\left(A^{\prime} B^{\prime}, P^{\prime} Q^{\prime}\right)$.
2. Prove that inversion preserves the angle of two circles or lines, in the special case when you have two lines that intersect in a point that is different from the center of the base circle. (Recall that the inverses of these lines are circles that contain the center of the base circle.)

## Questions to be answered in writing

1. Prove that inversion about the circle given by $x^{2}+y^{2}=1$ takes the point $(x, y) \neq 0$ into the point $\left(x /\left(x^{2}+\right.\right.$ $\left.y^{2}\right), y /\left(x^{2}+y^{2}\right)$.
2. Prove Napoleon's theorem: Given an arbitrary triangle $A B C_{\triangle}$, the centers of the equilateral triangles exterior to $A B C_{\triangle}$ form an equilateral triangle. (Illustration and hints on next page.)

Hints: Represent the points $A, B, C, A_{1}, B_{1}, C_{1}$ with complex numbers $a, b, c, a_{1}, b_{1}, c_{1}$. Observe that multiplying with

$$
\rho:=\frac{1}{\sqrt{3}}\left(\cos \left(30^{\circ}\right)+i \cdot \sin \left(30^{\circ}\right)\right)
$$

rotates the vector $\overrightarrow{B A}=a-b$ into $\overrightarrow{B C_{1}}=c_{1}-b$. Use this observation to express $c_{1}$ in terms of $a, b$ and $\rho$. Express then $a_{1}$ and $c_{1}$ similarly in terms of $a, b, c$ and $\rho$. Show that $c_{1}-a_{1}$ is obtained by multiplying $b_{1}-a_{1}$ with

$$
\frac{\rho}{1-\rho}=\frac{2 \rho-1}{\rho}=\frac{\rho-1}{2 \rho-1} .
$$

It is probably easier to do so if you find the quadratic equation whose roots are $\rho$ and its conjugate. Finally show that

$$
\frac{\rho}{1-\rho}=\cos \left(60^{\circ}\right)+i \cdot \sin \left(60^{\circ}\right)
$$

meaning that $\overrightarrow{A_{1} C_{1}}$ is obtained from $\overrightarrow{A_{1} B_{1}}$ by a $60^{\circ}$ rotation.
