Project 1 Questions

The first project is purely a tutorial to get you familiar with Matlab – both with some of its commands and using the program as well as finding a computer which has Matlab installed on it. Once you have found a computer with Matlab and read/worked through the tutorial, please answer the questions below. *Note: even if you have trouble accessing Matlab, you can answer most of the following questions just by reading the tutorial posted on the projects page of the class website.*

1. Where did you access Matlab?

2. What is a script M-file?

3. If you type a command in the workspace, explain the difference between ending the line (ie: command) with a semicolon or with no semicolon.

4. What is the diary command? Why would/could this be a useful command?

5. Look up how to publish an M-file. How is this different than the diary command? How is it similar? When would it be more desirable to use the publish versus the diary command?
